

CAMPING RESERVATION SYSTEM, METHOD AND PROGRAM

Abstract

A camping reservation system receives camping reservations from a camping facility agent or a user of a camping facility. The agent or the user enters information relating to the user, the user's camping vehicle, camping accommodations requested by the user, and reservation information. The reservation information is transferred to a transaction processor via a communications link, where the processor automatically generates transaction documents related to the user, the camping facility agent, and the camping reservation. A confirmation document is sent to the camping facility for which a camping pad has been reserved.
